Credit Risk Portfolio Overview

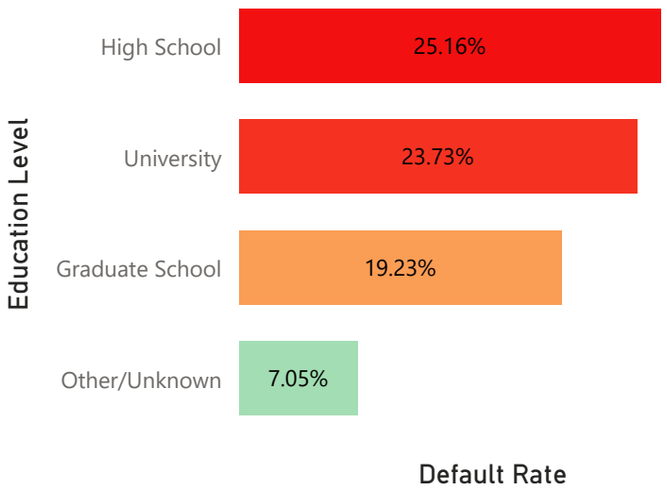
UCI Credit Card Dataset — Illustrative Analysis by Linh Dao

22.12%	11.30%	17.32%
Default Rate	Delinquency Rate	Probability of default (PD)

Portfolio Summary

The portfolio shows a default rate of 22.1%, with elevated risk among younger customers and those with lower credit limits. Education level also correlates with risk, with high-school customers showing the highest default rate. These patterns suggest opportunities for targeted limit management and early-intervention strategies.

Default Rate and Total customers by Education Level



Default Rate by Credit Limit Tiers

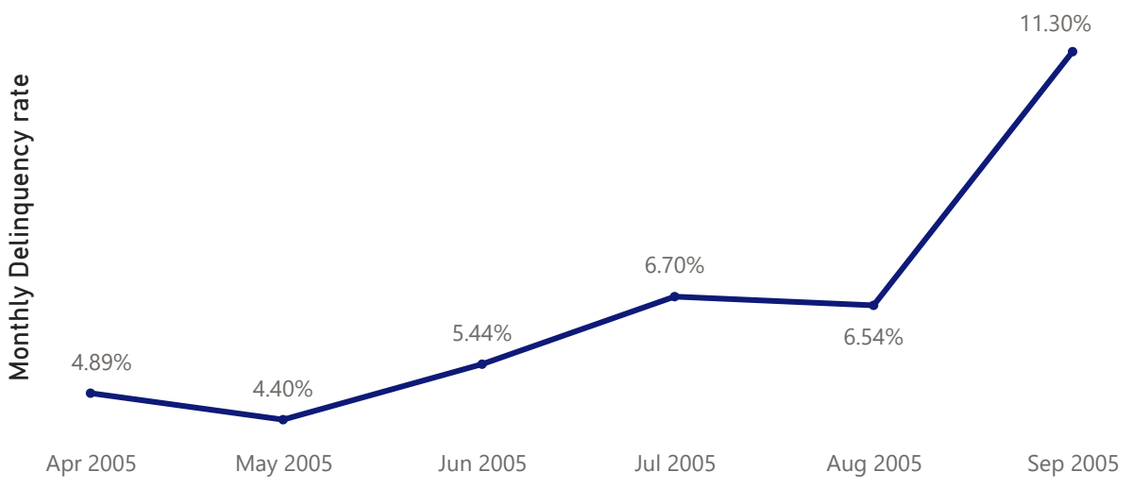
- High Default Risk
- Medium Default Risk
- Low Default Risk

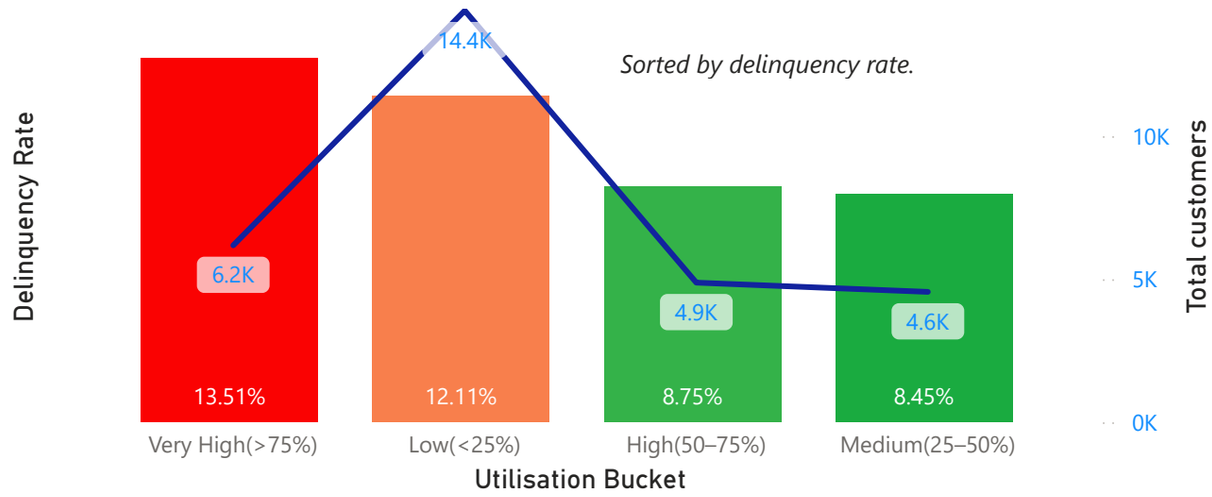
Benchmark note: Dataset sourced from Taiwan 2005. Comparisons to current Australian industry standards should be interpreted with caution due to temporal and geographic differences. External benchmark: APRA credit card performance data (apra.gov.au). Refer to latest ADI statistics for current industry default rates.

Delinquency Risk Analysis Dashboard

Monthly Delinquency Rate



Delinquency Rate and Total customers by Utilisation Bucket



Credit Utilisation Rate measures how much of a customer's credit limit is being used.

A **higher** utilisation rate indicates greater financial stress and a higher likelihood of default.
